

THE MOBILE PLUS

MOBILE RETAIL SALES INTELLIGENCE

Executive Summary

A Power BI Analytics Project on Multi-City Mobile Phone Sales

Oct 2021 – 2024 • 3,835 Transactions • ₹76.9 Cr Revenue • 19 Cities

THE DATA BEHIND THE DASHBOARD

About the Dataset

Every screen in this project is built on one clean, transaction-level dataset exported from Mobile Plus's point-of-sale records — 14 fields captured for each of 3,835 individual mobile phone purchases across the store network.

3,835

TRANSACTIONS

19,150

UNITS SOLD

₹76.9 Cr

TOTAL REVENUE

19

CITIES COVERED

FIELDS CAPTURED

- Transaction ID, Day, Month, Year, Day Name
- Brand, Mobile Model, Units Sold, Price per Unit
- Customer Name, Customer Age, City
- Payment Method, Customer Ratings (1–5)

COVERAGE BREADTH

- 5 brands: Apple, Samsung, OnePlus, Vivo, Xiaomi
- 15 mobile models, from SE to flagship tiers
- 4 payment channels: UPI, Debit, Credit, Cash
- Customers aged 18–59 across 19 Indian cities

WHY THIS PROJECT EXISTS

Problem Statement

Mobile Plus captures rich transaction-level data across its stores — brand, model, price, city, payment method and customer ratings — but that data sat in raw spreadsheets with no fast way to see performance trends, seasonal demand shifts, city concentration or channel mix. Decisions were being made on gut feel, one export at a time.

PROJECT OBJECTIVES

Consolidate multi-year, multi-city transaction data into one interactive Power BI dashboard

Track Total Sales, Quantity, Transactions and Average Order Value with drill-down by brand, model and payment method

Monitor Month-to-Date growth so under- or over-performance is caught early in each cycle

Compare performance to the Same Period Last Year across Month, Quarter and Year to separate real growth from seasonality

Guiding question: Where is Mobile Plus winning, where is revenue leaking, and what should happen next?

Overview Dashboard: Insights & Actions

KEY INSIGHTS

- iPhone SE, OnePlus Nord and Galaxy Note 20 lead by revenue but are tightly bunched (₹56M–₹60M) — no single model dominates the mix.
- Payment mix is balanced across UPI, Debit, Credit and Cash (24–26% each), so there's no risky dependency on one channel.
- Day-of-week sales skew highest on Monday and taper steadily toward Thursday — a weekday-led demand curve, not weekend-driven.
- Ratings lean positive: roughly 61% “Good” versus 22% “Poor” and 17% “Average” — solid overall, but the poor-rating tail is sizeable.
- Revenue is geographically concentrated in Delhi and Mumbai, with a long tail of mid-size cities trailing well behind.

CAN DO NOW

- ✓ Investigate the ~22% “Poor” ratings by city and model to isolate root cause.
- ✓ Keep marketing channel-agnostic given the balanced payment mix.
- ✓ Pre-position inventory ahead of the observed monthly demand swings.

COULD EXPLORE

- Pilot city-expansion in markets with a profile similar to Delhi/Mumbai.
- Run a Mon–Wed promotion to flatten the day-of-week curve.
- Auto-create a CRM follow-up ticket whenever a “Poor” rating is logged.

Month to Date Growth

MTD Growth Dashboard: Insights & Actions

KEY INSIGHTS

- The Month-to-Date view (shown for January 2022) climbs in a clean, steadily compounding curve from ₹0.4M to ₹22.8M — no plateau or reversal within the month.
- The Year / Quarter / Month / Day slicer lets any period be tracked in real time and benchmarked against “Same Period Last Year.”
- AOV for this filtered period (₹37.69K) sits a little below the full-period average (₹40.11K) — worth watching if the pattern repeats.
- Turning a static month-end total into a cumulative daily curve gives an early-warning signal: a flattening line mid-month would flag a shortfall before the books close.

CAN DO NOW

- ✓ Set a Day-15 MTD pace checkpoint as an internal trigger for corrective action.
- ✓ Reuse this MTD view every month via the existing slicer for rolling monitoring.

COULD EXPLORE

- Add a projected run-rate trendline so managers see expected month-end sales early.
- Overlay a target line on the MTD chart to show plan-vs-actual, not just YoY growth.

Total Sales and Same Period last Year by Year

Total Sales and Same Period last Year by Month

Total Sales and Same Period last Year by Quarter

YoY Comparison Dashboard: Insights & Actions

KEY INSIGHTS

- Revenue jumped from ₹0.06bn in the partial 2021 launch year to ₹0.26bn in 2022, then plateaued at ₹0.25bn through 2023 and into 2024 — growth has flattened after the initial ramp.
-
- Every quarter of the latest year lands in a tight ₹186M–₹196M band versus ₹128M–₹130M same period last year — consistent ~45–50% YoY growth, not a single seasonal spike.
-
- July is the strongest single month (~₹70M vs ~₹49M SPLY); February is consistently the softest month in both years.
-
- Qtr-1 2024 (₹61.7M) sits just below Qtr-1 2023 (₹62.9M) — the first quarter-level YoY dip in the dataset, notable even on a partial year.

CAN DO NOW

- ✓ Flag the Qtr-1 2024 dip to brand/category managers for a root-cause review.
- ✓
- ✓ Plan clearance promotions or marketing pushes specifically around February's softness.

COULD EXPLORE

- Add a rolling 12-month trendline to separate real deceleration from partial-year noise.
-
- Break the YoY view out by brand/model to find what's driving the post-2022 plateau.

BRINGING IT TOGETHER

Key Recommendations

- 01** Diagnose the “Poor” rating segment (~22% of orders) — the fastest near-term lever on margin and loyalty.
- 02** Expand beyond the Delhi–Mumbai concentration into similar-profile mid-tier cities.
- 03** Institutionalize MTD pace-tracking with a mid-month checkpoint and a forecasted run-rate line.
- 04** Investigate the Qtr-1 2024 YoY dip and the post-2022 growth plateau at brand/model level.
- 05** Build weekday- and February-specific promotional calendars around the observed demand patterns.
- 06** Layer forecasting and target lines across the MTD and YoY views to move from descriptive to predictive.
